

22. A study to assess the bone formed around immediate post extraction implants grafted with concentrated growth factor in the mandibular posterior region

DR. Punit Jain

A B Shetty Memorial Institute of Dental Sciences.

Extraction of the teeth and a healing period of 4-6 months followed by implant placement is a common procedure for the treatment of teeth with bad prognosis. This study was done to assess radio graphically the quantity and quality of bone formed in the region of mandibular first molar after extraction of the tooth and immediate implant placement with concentrated growth factor (cgf) grafting.
